Traffic And Transport Psychology Theory And Application:

Traffic and Transport Psychology Geoffrey Underwood, 2005-06-09 Just as our transport systems become more and more important to our economic and social well being so they become more and more crowded and more at risk from congestion disruption and collapse Technology and engineering can provide part of the solution but the complete solution will need to take account of the behaviour of the users of the transport networks The role of psychologists in this is to understand how people make decisions about the alternative modes of transport and about the alternative routes to their destinations to understand how novice and other vulnerable users can develop safe and effective behaviours how competent users can operate within the transport system optimally and within their perceptual and cognitive limitations The contributions to this volume address these issues of how the use of our transport systems can be improved by taking into account knowledge of the behaviour of the people who use the systems Topics discussed include driver training and licensing driver impairment road user attitudes and behaviour enforcement and behaviour change driver support systems and the psychology of mobility and transport mode choice This work will be of value not only to psychologists but to all transport professionals interested in the application of psychology to traffic

Dynamic Capacity Approach: Theory and Applications for Traffic Breakdown Assessment at Unsystematic Bottlenecks Sugiarto, 2022-12-30 Indonesia as an emerging country has a lot of traffic bottleneck challenges on urban road networks including in Banda Aceh the capital of

Aceh province It is due to high traffic demand and limited supply of roadway Consequently traffic congestion leads to several externalities such as unnecessary travel times air pollution energy consumption and driver frustration An unsystematic bottleneck defines as a bottleneck that is without any changes in roadway geometric and sometimes refers to hidden or virtual bottlenecks Therefore I wrote a basic traffic engineering book emphasizing the dynamic capacity method with application on virtual bottlenecks assessments This book is aimed at undergraduate and postgraduate civil engineers particularly dealing with traffic planning and operation at the virtual bottlenecks This book is essentially distinguished into six chapters Chapter I and II deals with the traffic mechanism at unsystematic bottlenecks and its theoretical foundation for assessing the speed and capacity drops due to an active unsystematic bottleneck The fundamental theory of static and dynamic approaches has been comprehensively discussed in this part The following part of the chapter III VI covers practical assessment by considering U turn and On street parking bottlenecks as case studies including simulation methods to determine measures of the effectiveness of the design improvements Data preparation observation analysis and simulation are broadly deliberated for easy understanding for undergraduate and postgraduate university students While this book is further intended for traffic engineering practitioners I suppose that it will also be worth practicing for traffic and transport engineers as designers or planners
