

The Digestive System

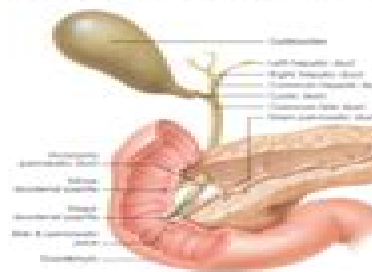

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food enters through the mouth, is broken down in the stomach, and then moves through the small intestine, where nutrients are absorbed. The digestive system also includes accessory organs that help in the process, such as the liver, pancreas, and gallbladder.

Liver, pancreas & gallbladder

After leaving the stomach, digested material enters the duodenum, the first part of the small intestine, where it is mixed with bile secreted by the **liver**. The liver is a large organ in the upper right of the abdomen. It produces bile, which is stored in the **gallbladder**. Bile then enters the duodenum to help in the digestion of fats.

Layers of large intestine

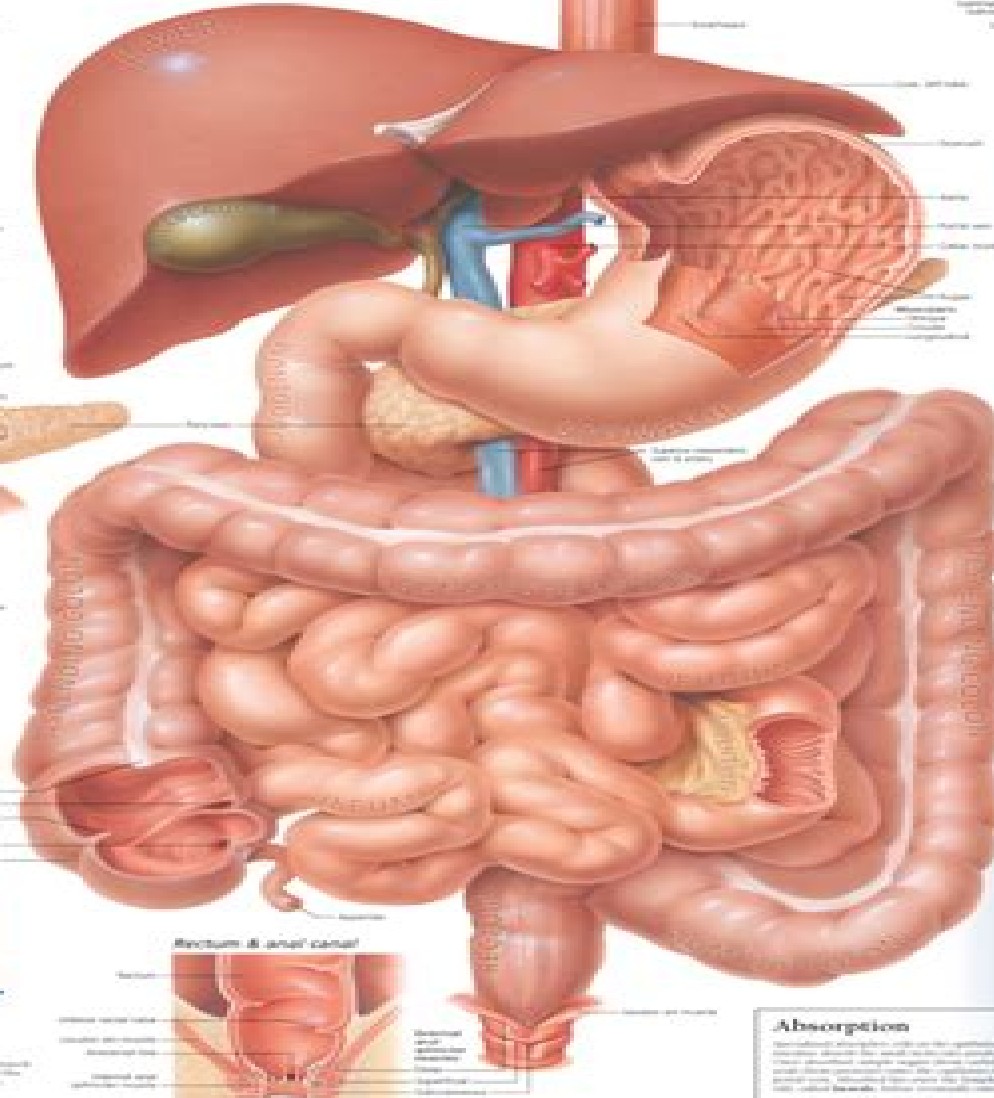

Large intestine

The large intestine consists of the cecum, the appendix, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. It is responsible for absorbing water and electrolytes from the remaining indigestible food matter, thereby forming feces.

Peristaltic action

Food material is pushed through the digestive system by a series of waves of muscular contraction called peristalsis. These contractions move the material forward and the wave retreats, which is called the peristaltic action.

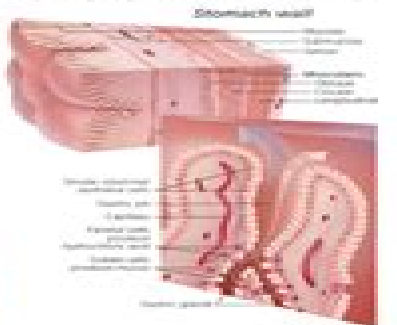

The mouth & salivary glands

Chewing the food breaks it into smaller pieces, making it easier to swallow. Saliva, secreted by the salivary glands, moistens the food and helps in the digestion of starches. The salivary glands are located in the mouth and throat.

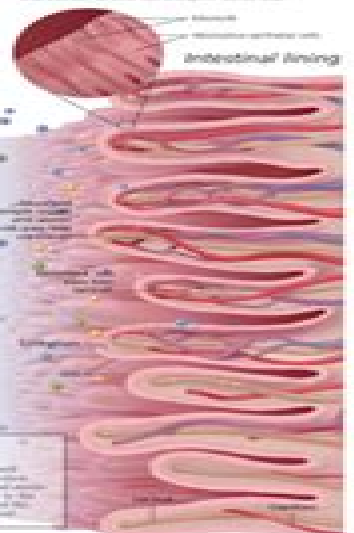

The stomach

The stomach is a large, muscular organ that is responsible for the digestion of food. It is located in the upper left of the abdomen. The stomach wall is composed of several layers of muscle, which contract to mix food with gastric juices.

Small intestine

The small intestine consists of three parts: the duodenum, the jejunum, and the ileum. It is responsible for the digestion of food and the absorption of nutrients. The small intestine is highly coiled and has a large surface area for absorption.

Absorption

The small intestine is responsible for the absorption of nutrients from the food. The nutrients are absorbed into the blood and lymphatic system. The large intestine is responsible for the absorption of water and electrolytes.
