Automated Optimization Methods for Scientific Workflows in e-Science Infrastructures Sonja Holl, 2014 Scientific workflows have emerged as a key technology that assists scientists with the design management execution sharing and reuse of in silico experiments Workflow management systems simplify the management of scientific workflows by providing graphical interfaces for their development monitoring and analysis Nowadays e Science combines such workflow management systems with large scale data and computing resources into complex research infrastructures For instance e Science allows the conveyance of best practice research in collaborations by providing workflow repositories which facilitate the sharing and reuse of scientific workflows However scientists are still faced with different limitations while reusing workflows One of the most common challenges they meet is the need to select appropriate applications and their individual execution parameters If scientists do not want to rely on default or experience based parameters the best effort option is to test different workflow set ups using either trial and error approaches or parameter sweeps Both methods may be inefficient or time consuming respectively especially when tuning a large number of parameters Therefore scientists require an effective and efficient mechanism that automatically tests different workflow set ups in an intelligent way and will help them to improve their scientific results This thesis addresses the limitation described above by defining and implementing an approach for the optimization of scientific workflows In the course of this work scientists needs are investigated and requirements are formulated resulting in an appropriate optimization concept In a following step this concept is prototypically implemented by extending a workflow management system with an optimization framework including general mechanisms required to conduct workflow optimization As optimization is an ongoing research topic different algorithms are provided by pluggable extensions plugins that can be loosely coupled with the framework resulting in a generic and quickly extendable system In this thesis an exemplary plugin is introduced which applies a Genetic Algorithm for parameter optimization In order to accelerate and therefore make workflow optimization feasible at all e Science infrastructures are utilized for the parallel execution of scientific workflows This is empowered by additional extensions enabling the execution of applications and workflows on distributed computing resources The actual implementation and therewith the general approach of workflow optimization is experimentally verified by four use cases in the life science domain All workflows were significantly improved which demonstrates the advantage of the proposed workflow optimization Finally a new collaboration based approach is introduced that harnesses optimization provenance to make optimization faster and more robust in the future
