Microcontroller and Smart Home Networks Dawoud Shenouda Dawoud,Peter Dawoud,2022-09-01 Over recent years industries have faced the problem of how to connect devices to speak to each other with minimum wiring Philips Semiconductors faced this problem when they needed to connect many ICs together The Automotive Industry faced the same problem when it needed to connect tens of microcontrollers in each car Recently with smart homes the problem has started to be part of each home For instance you may want to build your smart home with accessories from different manufacturers and you want the devices to speak to each other Added to that you may want to control them from a central App or voice assist Solutions for this problem started with the introduction of Inter Integrated Circuits IIC and Controller Area Networks CAN Both solutions are wired networks that allow ICs and microcontrollers to be connected in a network to communicate together In smart home automation a number of common smart home automation protocols that allow different devices to speak and communicate together have appeared during the last few decades Some of the smart home protocols come under the umbrella of what is called the Internet of Things IoT The proposed protocols can be grouped into wired networks e g X10 UPB wireless or radio networks as ZigBee Z Wave Bluetooth or dual wired and radio such as Insteon This book introduces to the reader some of the most popular Microcontroller and Smart home networks The book covers in detail the following protocols I2C I3C CAN ZigBee ZigBee Pro Z Wave Bluetooth Wi Fi WiMax and Insteon are part of our companion book Serial Communication Protocols and Standards This book gives detailed comparisons between the various protocols To complete the knowledge of the reader the book gives in the last chapter a short summary on the protocols that we did not fully cover in this volume Ethernet Thread Insteon X10 and UPB *Practical Embedded Security* Timothy Stapko,2011-04-01 The great strides made over the past decade in the complexity and network functionality of embedded systems have significantly enhanced their attractiveness for use in critical applications such as medical devices and military communications However this expansion into critical areas has presented embedded engineers with a serious new problem their designs are now being

targeted by the same malicious attackers whose predations have plagued traditional systems for years. Rising concerns about data security in embedded devices are leading engineers to pay more attention to security assurance in their designs than ever before. This is particularly challenging due to embedded devices' inherent resource constraints such as limited power and memory. Therefore, traditional security solutions must be customized to fit their profile and entirely new security concepts must be explored. However, there are few resources available to help engineers understand how to implement security measures within the unique embedded context. This new book from embedded security expert Timothy Stapko is the first to provide engineers with a comprehensive guide to this pivotal topic. From a brief review of basic security concepts through clear explanations of complex issues such as choosing the best cryptographic algorithms for embedded utilization, the reader is provided with all the information needed to successfully produce safe, secure embedded devices. The ONLY book dedicated to a comprehensive coverage of embedded security. Covers both hardware and software based embedded security solutions for preventing and dealing with attacks. Application case studies support practical explanations of all key topics including network protocols, wireless and cellular communications, languages, Java and C compilers, web based interfaces, cryptography, and an entire section on SSL.

The Emerging Domain of Cooperating Objects Pedro José Marrón, Stamatis Karnouskos, Daniel Minder, Aníbal Ollero, 2011-01-19. There are a number of different system concepts that have gained much relevance in the area of embedded systems over the past couple of years. First, there is the classic concept of embedded systems where the focus is on control systems for physical processes. Secondly, the notion of pervasive computing has evolved where the vision foresees everyday objects having some form of computation capacity and, in most cases, sensing and communication facilities. Thirdly, the notion of wireless sensor networks has arisen where small computing devices are able to sense their environment and cooperate in order to achieve a well-defined goal. These three types of quite diverse systems share a lot of commonalities on the one hand and, on the other hand, have some complementary aspects in common that make a combination of these systems into a coherent system vision promising. In particular, the important notions of control heterogeneity, wireless communication dynamic and ad hoc nature, and cost are prevalent to various degrees in each of these systems. A future system concept needs to combine the strong points of all three system concepts in at least these functional aspects. It has to provide support for the control of physical processes like today's embedded systems do, have as good support for device heterogeneity and spontaneity of usage as required by pervasive and ubiquitous computing approaches, and has to be as cost efficient and wirelessly agile as wireless sensor networks are. These new systems consist therefore of individual entities or objects that jointly strive to reach a common goal which will typically be a goal in sensing or control and are dynamically and loosely federating themselves for cooperation, taking care not to overtax their available resources. This book presents a roadmap to these concepts which are summarized as cooperating objects.
