Node Localization in Wireless Sensor Networks Xue Zhang, Cihan Tepedelenlioglu, Mahesh Banavar, Andreas Spanias, 2022-06-01 In sensor network applications measured data are often meaningful only when the location is accurately known In this booklet we study research problems associated with node localization in wireless sensor networks We describe sensor network localization problems in terms of a detection and estimation framework and we emphasize specifically a cooperative process where sensors with known locations are used to localize nodes at unknown locations In this class of problems even if the location of a node is known the wireless links and transmission modalities between two nodes may be unknown In this case sensor nodes are used to detect the location and estimate pertinent data transmission activities between nodes In addition to the broader problem of sensor localization this booklet studies also specific localization measurements such as time of arrival TOA received signal strength RSS and direction of arrival DOA The sequential localization algorithm which uses a subset of sensor nodes to estimate nearby sensor nodes locations is discussed in detail Extensive bibliography is given for those readers who want to delve further into specific topics
