Plant Genomes: Methods for Genetic and Physical Mapping J.S. Beckmann, T.C. Osborn, 2012-12-06 JACQUES S BECKMANN THOMAS C OSBORN Extraordinary progress has been made in the analyses of the genetic structures of higher eukaryotic genomes Only ten years elapsed between the initial proposals to use molecular DNA markers for the generation of a complete linkage map of the human genome 5 17 and the first description of a 10 centimorgan map of one of its chromosomes 22 soon to be followed by others The availability of molecular DNA markers henceforth called genomic markers for a review of their properties see 1 2 20 represents a milestone in genetics by providing the capacity for complete genetic coverage of all genomes It is important to remember that the nature of the DNA polymorphism or of the specific method used to uncover it can be quite different for different marker loci The genetic variation detected can be a result of a simple point mutation a DNA insertion deletion event or a change in repeat copy number at some hypervariable DNA 11 or micro satellite 21 motif Currently the methods of detection can involve use of restriction endonucleases nucleic acid hybridization or DNA sequence amplification Each of these sources of variation and methods of detection can have utility for different applications Furthermore new approaches for the detection of DNA polymorphism are constantly emerging The primary concern here is that the monitored polymorphism defines a genetic marker useful for the desired application
