

```

Radim fp_image (m_ImageWidth * m_ImageHeight)

IError = m_FPM.GetImage (fp_image)
IError = m_FPM.CreateTemplate (fp_image, m_RegMin1)

```

When templated is created, template information such as fingerprint position and view number can be inserted into a template. To insert a template information, use **CreateTemplate(SGFPMFingerInfo* fingerInfo, Byte rawImage[], Byte minTemplate[])**

```

(C#)
SGFPMFingerInfo finger_info = new SGFPMFingerInfo();
finger_info.FingerNumber = SGFPMFingerPosition.FINGERPOS_RT;
finger_info.ImageQuality = (Int16)img_qilty;
finger_info.ImpressionType = (Int16)SGFPMImpressionType.INPTYPE_LP;
finger_info.ViewNumber = 1;

error = m_FPM.CreateTemplate(finger_info, fp_image, m_RegMin2);

```

2.9. Matching Templates

Templates are matched during both registration and verification processes. During registration, it is recommended to capture at least two image samples per fingerprint for a higher degree of accuracy. The minutiae data from each image sample can then be compared against each other (i.e. matched) to confirm the quality of the registered fingerprints. This comparison is analogous to a password confirmation routine that is commonly required for entering a new password.

During verification, newly input minutiae data is compared against registered minutiae data. Similar to the registration process, verification requires the capture of a fingerprint image followed by extraction of the minutiae data from the captured image into a template. The security level can be adjusted according to the type of application. For example, the security level for an application using fingerprint-only authentication can be set higher than **SGFPMSecurityLevel.Normal** to reduce false acceptance (FAR).

To match templates, the FDx SDK Pro provides three kinds of matching functions. Each function requires two sets of template data for matching.

- **MatchTemplate()**: This function matches templates having the same format as the default format. When calling this function, each template should include only one sample (or view) per template. The default format is SG400 (SecuGen proprietary format) but can be changed by calling **SetTemplateFormat()**. For more information about template formats, refer to [Section 2.1.4 Template Format](#).
- **MatchTemplateEx()**: This function can match templates having different template formats. This function can also specify the template format for each template and can match templates that have multiple views per template.
- **MatchAnsiTemplate()**: This function is the same as **MatchTemplateEx()** except that it supports only ANSI378 templates.

Function	Template Format	Can match templates with different formats?
MatchTemplate	SG400 (System default)	No
MatchTemplateEx	Specified template format	Yes
MatchAnsiTemplate	ANSI378	No
MatchIsoTemplate	ISO19794-2	No
