Forensic Gait Analysis Ivan Birch, Michael Nirenberg, Wesley Vernon, Maria Birch, 2020-07-07 Gait analysis is the systematic study of human walking using the eye and brain of experienced observers augmented by instrumentation for measuring body movements body mechanics and the activity of the muscles Since Aristotle's work on gait analysis more than 2000 years ago it has become an established clinical science used extensively in the healthcare and rehabilitation fields for diagnosis and treatment Forensic Gait Analysis details the more recent and rapidly developing use of gait analysis in the forensic sciences The book considers the use of observational gait analysis based on video recordings to assist in the process of identification or exclusion With the increase in use of CCTV and surveillance systems over the last 20 to 30 years there has been a steady and rapid increase in the use of gait as evidence Currently gait analysis is widely used in the UK in criminal investigations with increasing awareness of its potential use in the US Europe and globally The book details the history of the science current practices and of the emergent application to establish best practice standards that conform to those of other forensic science disciplines Engagement with the Forensic Science Regulator and the Chartered Society of Forensic Sciences in the UK and the International Association for Identification has helped to ensure and enhance the quality assurance of forensic gait analysis However there remains a

fundamental lack of standardized training and methodology for use in evidentiary and investigative casework This book fills that void serving as one of the first to describe the current state of practice capabilities and limitations and to outline methods standards of practice and expectations of the gait analyst as a forensic practitioner Forensic Gait Analysis reflects current research and forensic practice and will serve as a state of the art guide to the use of gait analysis in the forensic context for both education and training purposes It will be a welcome addition to the libraries of professionals in the areas of podiatry gait analysis forensic video analysis law enforcement and legal practice Forensic Gait Analysis Haydn D.

Capacitive Floor Sensors for Human Gait Assessment Using Artificial Neural Networks Raoul Hoffmann,2023 Gait analysis is valuable in medical research and diagnosis by delivering information that helps in choosing methods of intervention and rehabilitation that are beneficial for a patient In gait laboratories cameras or IMUs are often used to gather gait patterns This thesis explores the possibility of using sensors below the floor as a gait data source These sensors measure changes in the electrical capacitance to recognise steps The construction is designed for indoor environments and is hidden under common flooring layer types Therefore it is very robust and suitable for practical use in daily clinical routine A formal framework was developed to represent the measurements considering the special characteristics of this floor sensor The data were then used as input for artificial neural networks that were applied on classification and regression tasks In a feature construction and extraction approach the spatial spread of footfalls was derived and used with a feed forward neural network

Then in a feature learning approach the time series data was transformed into a local receptive field and used with a recurrent neural network Three studies were conducted for the goals to distinguish between people with low and high risk of falling to estimate age and to recognise walking challenges as an external gait intervention The combination of a robust and hidden floor sensor and machine learning opens up the prospect of future applications in health and care
