Plasticity of GABAergic Synapses Andrea Barberis, Alberto Bacci, 2016-01-22 Learning and memory are believed to depend on plastic changes of neuronal circuits due to activity dependent potentiation or depression of specific synapses During the last two decades plasticity of brain circuits was hypothesized to mainly rely on the flexibility of glutamatergic excitatory synapses whereas inhibitory synapses were assumed relatively invariant to ensure stable and reliable control of the neuronal network As a consequence while considerable efforts were made to clarify the main mechanisms underlying plasticity at excitatory synapses the study of the cellular molecular mechanisms of inhibitory plasticity has received much less attention Nevertheless an increasing body of evidence has revealed that inhibitory synapses undergo several types of plasticity at both pre and postsynaptic levels Given the crucial role of inhibitory interneurons in shaping network activities such as generation of oscillations selection of cell assemblies and signal integration modifications of the inhibitory synaptic strength represents an extraordinary source of versatility for the fine control of brain states This versatility also results from the rich diversity of GABAergic neurons in several brain areas the specific role played by each inhibitory neuron subtype within a given circuit and the heterogeneity of the properties and modulation of GABAergic

synapses formed by specific interneuron classes The molecular mechanisms underlying the potentiation or depression of inhibitory synapses are now beginning to be unraveled At the presynaptic level retrograde synaptic signaling was demonstrated to modulate GABA release whereas postsynaptic forms of plasticity involve changes in the number gating properties of GABAA receptors and or shifts of chloride gradients In addition recent research indicates that GABAergic tonic inhibition can also be plastic adding a further level of complexity to the control of the excitatory inhibitory balance in the brain The present Topic will focus on plasticity of GABAergic synapses with special emphasis on the molecular mechanisms of plasticity induction and or expression

Lysophospholipid Receptors Jerold Chun, 2013-04-01 The current state of the science supporting new research in lysophospholipids The study of lysophospholipids exploded with the discovery of cell surface receptors on both lysophosphatidic acid LPA and sphingosine 1 phosphate S1P Since then thousands of original research reports ranging from fundamental cell signaling to the physiology and pathophysiology of individual organ systems have centered on lysophospholipids This book draws together and analyzes the current literature to provide readers with a state of the science review as well as current techniques that support research in all aspects of the field of lysophospholipid signaling *Lysophospholipid Receptors* is divided into three sections Receptors and other possible effectors Enzymes Physiology and pathophysiology Within each section the authors explain the similarities and differences between LPA and S1P signaling Examples are provided that demonstrate the underlying mechanisms of lysophospholipid signaling across a broad range of organ systems such as S1P signaling in cardiovascular physiology and disease and the neural effects of LPA signaling Extensive references at the end of each chapter provide a gateway to the literature and facilitate further research into individual topics Each chapter has been authored by one or more leading international authorities in lysophospholipid research Based on a thorough analysis of the current research the authors set forth what is established science and offer their expert opinion and perspective on new and emerging areas of research setting the stage for further investigations that will solve current problems in the field

Sulfur-Containing Marine Bioactives Anna Palumbo, 2021-03-24 Sulfur is an essential element for all living organisms and is required by algae plants fungi animals and humans for growth and development It is present in a variety of biomolecules involved in many biological functions including the maintenance of cell redox homeostasis defense and detoxifying processes The alteration of sulfur compound metabolism may lead to human diseases as well as to plant and animal pathologies The marine environment which is characterized by a high biodiversity of species and a great chemical diversity represents a great potential source of bioactive sulfur molecules A broad range of biologically active sulfur compounds with unique structures and pharmacological properties have been reported to occur in marine organisms from amino acids to different sulfated derivatives Great attention is also focused on sulfur metabolites in the marine microbial world in relation to the global sulfur cycle The aim of this Special Issue is to present existing knowledge and recent studies on sulfur containing marine bioactive compounds in different biological systems Attention is also focused

on metabolites active at the ecological level Immunity and Immunopathogenesis to Herpesviruses Susmit Suvas, Richard D. Dix, 2020-01-20 Herpesviruses are a large group of double stranded DNA viruses which have evolved strategies to persist and disseminate widely throughout the human population Unlike RNA viruses which have the ability to alter their antigenic expression profile to evade host immune responses herpesviruses can establish life long latency in the infected host Herpesviruses are divided into alpha beta and gamma herpesviruses sub families The human members of the alpha herpesvirinae subfamily is comprised of herpes simplex virus 1 and 2 HSV 1 and HSV 2 and of varicella zoster virus VZV These viruses are considered neurotropic as they can i infect nerve endings ii traffic via neuronal axons and iii establish latency in neuronal nuclei On the other hand the members of the beta herpesvirinae subfamily such as human cytomegalovirus HCMV human herpesviruses 6 and 7 HHV 6 and HHV 7 are known to establish latent infections in immune cell types such as monocytes and T cells Epstein Barr Virus EBV is a member of gamma herpesvirinae subfamily that establishes latency in B lymphocytes Additionally HHV 8 also known as Kaposi s Sarcoma Associated Herpes virus KSHV is a herpes virus which establishes latency in monocytes dendritic cells B lymphocytes and endothelial cells of the host Image Processing with MATLAB Omer Demirkaya, Musa H. Asyali, Prasanna K. Sahoo, 2008-12-22 Image Processing with MATLAB Applications in Medicine and Biology explains complex theory laden topics in image processing through examples and MATLAB algorithms It describes classical as well emerging areas in image processing and analysis Providing many unique MATLAB codes and functions throughout the book covers the theory of probability an **Development of Circadian Clock Functions, volume II** Daisuke Ono, Takahiro J. Nakamura, Jeff Jones, Jihwan Myung, Rae Silver, 2024-07-31 The temporal order of physiological functions such as sleep wakefulness is regulated by the circadian clock This intrinsic clock starts ticking in the embryo and matures during development with attenuation of the clock function in the elderly illustrated by attenuation of synchrony entrainment and outputs of cellular circadian rhythms in the SCN This age related diminution can contribute to the emergence of diseases such as sleep disorders infertility diabetes mental disorders etc Over the course of our lives a variety of internal and external factors are under the influence of the circadian clock This inherent developmental plasticity of the circadian system is critical for the establishment of normal bodily functions to adapt to the changing environment on earth In mammals the central circadian clock is located in the suprachiasmatic nucleus SCN of the hypothalamus Circadian rhythms in the SCN are observed during the embryonic period and input and output pathways from the SCN are formed after birth During postnatal development functions of neurotransmitters in the SCN are changed which have an influence on special temporal patterns of circadian rhythms in the SCN and outputs signals to the outside of the SCN During postnatal development properties of circadian rhythms in the SCN and its inputs and outputs can be modulated by environmental light conditions Recent optical manipulation and imaging techniques have revealed that cell type specific functions for circadian rhythms However it remains unclear which cell types or networks in the brain are modulated during
