Characterization of Arabidopsis Thaliana Defense Responses to the Silverleaf Whitefly Louisa Anne Kempema, 2007 [Autophagy in plants and algae](#) Diane C Bassham, Jose L Crespo, 2015-05-15 Autophagy also known as macroautophagy is an evolutionarily conserved process by which cytoplasmic components are nonselectively enclosed within a double membrane vesicle known as the autophagosome and delivered to the vacuole for degradation of toxic components and recycling of needed nutrients This catabolic process is required for the adequate adaptation and response of the cell and correspondingly the whole organism to different types of stress including nutrient starvation or oxidative damage Autophagy has been extensively investigated in yeasts and mammals but the identification of autophagy related ATG genes in plant and algal genomes together with the characterization of autophagy deficient mutants in plants have revealed that this process is structurally and functionally conserved in photosynthetic eukaryotes Recent studies have demonstrated that autophagy is active at a basal level under normal growth in plants and is upregulated during senescence and in response to nutrient limitation oxidative stress salt and drought conditions and pathogen attack Autophagy was initially considered as a non selective pathway but numerous observations mainly obtained in yeasts revealed that autophagy can also selectively eliminate specific proteins protein complexes and organelles Interestingly several types of selective autophagy appear to be also conserved in plants and the degradation of protein aggregates through specific adaptors or the delivery of chloroplast material to the vacuole via autophagy has been reported This research topic aims to gather recent progress on different aspects of autophagy in plants and algae We welcome all types of articles including original research methods opinions and reviews that provide new insights about the autophagy process and its regulation **Two-Component Signaling Systems, Part B**, 2007-07-03 Multicellular organisms must be able to adapt to cellular events to accommodate prevailing conditions Sensory response circuits operate by making use of a phosphorylation control mechanism known as the two component system Sections in Two Component Signaling Systems Part B include Structural Approaches Reconstitution of Heterogeneous Systems Intracellular Methods and Assays Genome Wide Analyses of Two Component Systems Presents detailed protocols Includes troubleshooting tips *Basic Science Methods for Clinical Researchers* Morteza Jalali, Francesca Yvonne Louise Saldanha, Mehdi Jalali, 2017-03-31 Basic Science Methods for Clinical Researchers addresses the specific challenges faced by clinicians without a conventional science background The aim of the book is to introduce the reader to core experimental methods commonly used to answer questions in basic science research and to outline their relative strengths and limitations in generating conclusive data This book will be a vital companion for clinicians undertaking

laboratory based science It will support clinicians in the pursuit of their academic interests and in making an original contribution to their chosen field In doing so it will facilitate the development of tomorrow s clinician scientists and future leaders in discovery science Serves as a helpful guide for clinical researchers who lack a conventional science background Organized around research themes pertaining to key biological molecules from genes to proteins cells and model organisms Features protocols techniques for troubleshooting common problems and an explanation of the advantages and limitations of a technique in generating conclusive data Appendices provide resources for practical research methodology including legal frameworks for using stem cells and animals in the laboratory ethical considerations and good laboratory practice GLP
