Soil Formation Nico van Breemen, Peter Buurman, 2007-08-20 Soils form a unique and irreplaceable essential resource for all terrestrial organisms including man Soils form not only the very thin outer skin of the earth's crust that is exploited by plant roots for anchorage and supply of water and nutrients Soils are complex natural bodies formed under the influence of plants microorganisms and soil animals water and air from their parent material i.e. solid rock or unconsolidated sediments Physically chemically and mineralogically they usually differ strongly from the parent material and normally are far more suitable as a rooting medium for plants In addition to serving as a substrate for plant growth including crops and pasture soils play a dominant role in the biogeochemical cycling of water carbon nitrogen and other elements influencing the chemical composition and turnover rates of substances in the atmosphere and the hydrosphere Soils take decades to millennia to form We tread on them and do not usually see their interior so we tend to take them for granted But improper and abusive agricultural management careless land clearing and reclamation man induced erosion salinisation and acidification desertification air and water pollution and withdrawal of land for housing industry and transportation now destroy soils more rapidly than they can be formed **Geotechnical Engineering in the XXI Century: Lessons learned**
