Code Generation in

Microsoft .NET Kathleen Dollard,2014-07-08 Code generation has the potential to revolutionize application development Rather than handcrafting each piece of code developers are increasingly turning to code generation based on templates and applications of business logic to automatically perform a variety of tasks This book teaches the technical details of code generation in NET through a coherent series of steps that will help you to incorporate code generation into your own development efforts Veteran author Kathleen Dollard teaches code generation as a scripted repeatable process using templates you control so you're not tied to a particular framework or style Because you can regenerate code at any time you can incorporate changes including database changes throughout the life of your application The templates are flexible and

designed to work smoothly with the handcrafted code you'll use to customize your application. The underlying fundamentals are explained along with three specific techniques: outputting code to a stream using the Code DOM and using XSLT based code generation. In addition to the text, the tools in the book are downloadable in both VB .NET and C#. They include a mechanism to extract information from SQL Server, a tool for editing and running code generation scripts, a simple flexible ORM tool that relates your database structure to your runtime class model, and a set of templates you can use as the starting point for your adventures in code generation. Generating repetitive sections of code frees you to focus on the features that make your application unique. Code generation will turbo charge your development cycles by offering speed, reusability, agility, and consistency. Go forth and generate.

Semantic Web a major endeavor in current Web research where the World Wide Web Consortium W3C plays an important role The main idea of the Semantic Web is to enrich Web data with meta data carrying a meaning of the data and allowing Web based systems to reason about data and meta data The meta data used in Semantic Web applications is usually linked to a conceptualization of the application domain shared by different applications Such a conceptualization is called an ontology and specifies classes of objects and relations between them Ontologies are defined by ontology languages based on logic and supporting formal reasoning Just as the current Web is inherently heterogeneous in data formats and data semantics the Semantic Web will be inherently heterogeneous in its reasoning forms Indeed any single form of reasoning turns out to be insufficient in the Semantic Web
