APLICACIÓN

El Aquilion es un tomógrafo helicoidal multislice que permite examinar el cuerpo entero.

El sistema genera 16 cortes por revolución usando el detector multicorte seleccionable de espesor de corte (SSMD). Además, el mecanismo de alta rotación y la unidad de rápida reconstrucción del sistema permite una rápida adquisición de la imagen para mejorar el rendimiento de los exámenes.

CARACTERÍSTICAS

• Tomografía de alta velocidad

Este sistema permite la adquisición simultánea de 16 cortes en 0.5 segundos de rotación usando al SSMD y produciendo la adquisición de datos volumétrica. El tiempo de espera para enfriar el Tubo de Rayos X se acorta porque el tiempo de exposición es corto. Por consiguiente, el tiempo de espera del paciente y el rendimiento específico son mejorados.

• Gran variedad de espesores de cortes

El SSMD, que provee la resolución de alta velocidad y alta examinación, permite cortar en cortes de espesores de 0.5 mm, 1 mm, 2 mm, 3 mm, 4 mm, 6 mm, 8 mm a ser seleccionados, basados en los objetivos de los exámenes.

• Reconstrucción de imagen avanzada

El sistema emplea la técnica de reconstrucción helicoidal TCOT (Tomografía de rayo-cónico real), el que compensa precisamente el ángulo del cono basado en el método de Feldkamp, de esa manera minimizando los artefactos relacionados al ángulo del cono y provee precisión, imágenes de alta resolución isotrópica a lo largo de todo el campo de la imagen.

• Alta calidad en imagen

El sistema logra bajo contraste en la resolución de 2 mm en 0.3%, y en alto contraste en la resolución de 0.35 mm. El escáner helicoidal multicorte puede ser administrado en relación costo-beneficio usando capas delgadas de corte en exámenes de rutina, y es tal esa alta precisión que imágenes en múltiples planos y en tres dimensiones pueden ser generadas de los datos del voxel de alta resolución. En la angiografía del cerebro, por ejemplo, una distancia de 40-mm puede ser examinada en 4 segundos con un espesor de corte de 0.5 mm. El uso de "adquisiciones apiladas" con cortes delgados minimiza el artefacto producido por el volumen parcial.

• Alto rendimiento para el flujo de pacientes

En combinación con una rápida tomografía, el generador de rayos x de alta energía de 60-kW y el Tubo de Rayos X 7.5-MHU, permiten adquirir los datos para exámenes de rutina, biopsia y generación de tres dimensiones en una sola adquisición tomográfica.

La imagen de cualquier espesor de corte puede ser generada más tarde en una nueva reconstrucción. Por ejemplo, después de que la tomografía de corte de 2mm sea realizada, las imágenes de varios espesores de corte pueden ser generados de datos sin procesar como una imagen gruesa de 10mm para exámenes de rutina, una imagen gruesa 5mm para examen de detalle, e imagen 0.5mm o 1mm para la generación de un volumen 3D.

• Angulación de escaneo helicoidal

El escaneo helicoidal con angulación de la estructura de adquisición (gantry), desde 30° hacia adelante y 30° hacia atrás, está disponible porque el sistema emplea la técnica de reconstrucción TCOT.

• Fluoroscopia por tomografía multislice (opcional)

La fluoroscopia convencional muestra sólo un corte, pero la fluoroscopia por tomografía multicorte permite en tiempo real obtener 3 imágenes por combinación de los datos provenientes de SSMD. La fluoroscopia mediante tomografía multicorte mejora significativamente la operatividad en los procedimientos de biopsia y de intervencionismo.
