Crystalline Bacterial Cell Surface Layers Uwe B. Sleytr, Paul Messner, Dietmar Pum, Margit Sara, 2012-12-06 Crystalline surface layers S layers represent an almost universal feature of archaeobacterial cell envelopes and can be found in gram positive and gram negative eubacterial species from nearly all phylogenetic branches S layers consist of a single protein or glycoprotein species and thus can be considered as one of the most primitive membrane structures developed during evolution Prokaryotes carrying S layers are ubiquitously found in every part of the biosphere This supports the concept of a general supramolecular porous crystalline surface layer fulfilling a broad spectrum of functions which are strongly dependent on the particular environmental and ecological conditions Their structural simplicity makes S layers a suitable model for analyzing structure function relationships as well as dynamic aspects of membrane morphogenesis
