

1 To move the mount left and right, loosen the azimuth tension knob located on the yoke mount between two of the tripod legs.

2 Hold the tripod leg with one hand and grab the telescope tube focuser and move it left or right as desired. The amount of tension you feel when moving the telescope can be adjusted by tightening or loosening the knob to a level that is comfortable for you.

3 To move the telescope up and down, hold the focuser of the telescope in one hand and loosen the knob on the slow motion rod guide. The telescope can now be moved up or down as desired. When you are close to your target, tighten the knob to secure the telescope in place.

4 Fine adjustment in the up-and-down direction can be done using the altitude slow motion rod. Keep the rod guide knob locked and rotate the black handle on the slow motion rod. This allows you to move the telescope in small increments to help center objects or follow celestial objects in the night sky.

5 The altitude slow motion rod has a limited range of motion of about 15 degrees. If you run into the end of travel and the knob will no longer turn, you can reset it by loosening the rod guide knob and turning the slow motion rod handle the opposite direction until you are in the middle of its travel, then retighten the rod guide knob.
