Understanding Vision Theory Models And Data:

Understanding Vision Li Zhaoping, 2014-05-08 While the field of vision science has grown significantly in the past three decades there have been few comprehensive books that showed readers how to adopt a computational approach to understanding visual perception along with the underlying mechanisms in the brain Understanding Vision explains the computational principles and models of biological visual processing and in particular of primate vision The book is written in such a way that vision scientists unfamiliar with mathematical details should be able to conceptually follow the theoretical principles and their relationship with physiological anatomical and psychological observations without going through the more mathematical pages For those with a physical science background especially those from machine vision this book serves as an analytical introduction to biological vision It can be used as a textbook or a reference book in a vision course or a computational neuroscience course for graduate students or advanced undergraduate students It is also suitable for self learning by motivated readers in addition for those with a focused interest in just one of the topics in the book it is feasible to read just the chapter on this topic without having read or fully comprehended the other chapters In particular Chapter 2 presents a brief overview of experimental observations on biological vision Chapter 3 is on encoding of visual inputs Chapter 5 is on visual attentional selection driven by sensory inputs and Chapter 6 is on visual perception or decoding Including many examples that clearly illustrate the application of computational principles to experimental observations Understanding Vision is valuable for students and researchers in computational neuroscience vision science machine and computer vision as well as physicists interested in visual processes Computational Knowledge Vision Wenbo Zheng, Fei-Yue

Wang, 2024-08-19 Computational Knowledge Vision The First Footprints presents a novel advanced framework which combines structuralized knowledge and visual models In advanced image and visual perception studies a visual model s understanding and reasoning ability often determines whether it works well in complex scenarios This book presents state of the art mainstream vision models for visual perception As computer vision is one of the key gateways to artificial intelligence and a significant component of modern intelligent systems this book delves into computer vision systems that are highly specialized and very limited in their ability to do visual reasoning and causal inference Questions naturally arise in this arena including 1 How can human knowledge be incorporated with visual models 2 How does human knowledge promote the performance of visual models To address these problems this book proposes a new framework for computer vision computational knowledge vision Presents a concept and basic framework of Computational Knowledge Vision that extends the knowledge engineering methodology to the computer vision field Discusses neural networks meta learning graphs and Transformer models Illustrates a basic framework for Computational Knowledge Vision whose essential techniques include structuralized knowledge knowledge projection and conditional feedback **Computer Vision - ECCV 2024** Aleš

Vision and Brain James V. Stone, 2012-09-21 An engaging introduction to the science of vision that offers a coherent account of vision based on general information processing principles In this accessible and engaging introduction to modern vision science James Stone uses visual illusions to explore how the brain sees the world Understanding vision Stone argues is not simply a question of knowing which neurons respond to particular visual features but also requires a computational theory of vision Stone draws together results from David Marr's computational framework Barlow's efficient coding hypothesis Bayesian inference Shannon's information theory and signal processing to construct a coherent account of vision that explains not only how the brain is fooled by particular visual illusions but also why any biological or computer vision system should also be fooled by these illusions This short text includes chapters on the eye and its evolution how and why visual neurons from different species encode the retinal image in the same way how information theory explains color aftereffects how different visual cues provide depth information how the imperfect visual information received by the eye and brain can be rescued by Bayesian inference how different brain regions process visual information and the bizarre perceptual consequences that result from damage to these brain regions The tutorial style emphasizes key conceptual insights rather than mathematical details making the book accessible to the nonscientist and suitable for undergraduate or postgraduate study
