

Installation

Electrical connection

The electric panel is located in the unit compressor section. Remove the compressor access panel. The unit is designed to run with 400 V $\pm$ 5%/50 Hz/ 3 ph.

Factory supplied disconnect switch (option)

The disconnect switch is factory mounted. It is located in the compressor section. Mount the disconnect switch onto the exterior of the unit, between the condenser coil and the electrical panel (near the unit top corner). Wire the disconnect switch from the power terminal block in the panel to the disconnect switch with the wire bundle provided by following the electrical diagram found in the unit.

Over current protection

The branch circuit feeding the unit must be protected in accordance with national or local codes and maximum unit amps indicated in Table 36.

Power wiring

The unit's power supply must be provided by 4-wire cable with cross-sectional areas complying with legislation.

The power supply cables must be laid in leak-tight pipes and pass through the bottom of the electric panel for units without electric heaters and through the heat section when electric heater option is selected. The cables must not be taut.

Appropriate connectors must be provided. Flexible pipe supports are required to prevent noise transmission in the building's structure. Ensure all the connections are tightened.

Note:

1. Earthing must be executed in compliance to national and local legislation.
2. The machines are designed for a short-circuit current of 10 kA. In the event of a higher application, contact your local sales office.

Compressor electrical phasing

Proper phasing of the electrical power wiring is critical for proper operation and reliability of the scroll compressor and fans.

Proper rotation of the scroll compressor must be established before the unit is started. This is accomplished by confirming that the electrical phase sequence of the power supply is correct. The motor is internally connected for clockwise rotation with the inlet power supply phased A,B,C.

The direction of rotation may be reversed by interchanging any two of the line wires. It is this possible interchange of wiring that makes a phase sequence indicator necessary if the operator is to quickly determine the phase rotation of the compressor motor.
